

ROLE PLAYBOOK · OPERATIONS · V1.0

The Operations AI-Native Playbook

Turn useful AI shortcuts into documented workflows a colleague can run. This playbook helps operations teams move from ad hoc AI use to repeatable, reviewable work.

The operating principle

A shortcut is not an operating improvement until someone else can run it, review it, and measure it.

Operations teams often find the first practical AI wins: procedure cleanup, checklist drafts, handoff summaries, ticket triage, exception notes, and recurring internal briefs. The risk is that the win stays trapped in one person's prompt history. Operational value appears when the workflow is documented, reviewed, handed off, and measured.

WHAT'S INSIDE

1. Executive snapshot

2. Immediate operations use cases

3. Repeatable workflow model
4. Operations checklist

5. Toolbox artifacts

6. 30-day implementation path

7. Source basis

Operations enablement map

DIMENSION	OPERATING DECISION
Primary goal	Repeatable workflows
Core artifact	Workflow SOP
Risk focus	Consistency, handoff readiness, review, and measurement
Recommended path	Free Assessment → Foundation Course → Workflow SOP → Sandbox Practice

Where operations can use AiBI immediately

Document a recurring task

Capture the input, AI draft, review, and output steps for a task your team repeats weekly.

Artifact: Workflow SOP.

Build a reusable working brief

Turn a one-off prompt into a fill-in-the-blank template the whole team can run.

Artifact: Reusable AI brief.

Define the review step

Make explicit who checks the AI output, against what, before it is used.

Artifact: Review checkpoint.

Measure the time saved

Baseline the manual version, then track draft time and correction rate on the AI version.

Artifact: Time-saved log.

The risk line

Start with internal, low-risk work. Do not put real customer data, complaint specifics, confidential account details, or regulated decisioning material into an AI step unless the tool and workflow are formally approved for that data class.

A rhythm that survives turnover

1. **Map.** Pick one recurring, low-risk task and write down how it actually gets done today. Artifact: Current-state map.
2. **Draft.** Build the AI step in the sandbox with a reusable brief and a named review checkpoint. Artifact: Workflow SOP draft.
3. **Test.** Run it on real work for a week. Track draft time, correction rate, and where it breaks. Artifact: Test log.
4. **Hand off.** Give the SOP to a colleague cold. If they can run it unaided, it is done. Save it to the Toolbox. Artifact: Handoff-ready SOP.

Operations checklist

- The task is internal and low-risk to start.
- No real customer data enters the AI step.
- A named human review checkpoint exists.
- The SOP names inputs, the AI step, the review, and the output.
- A colleague could run it without you in the room.
- Time saved and correction rate are tracked.

Toolbox artifacts

ARTIFACT	USE IT FOR	STATUS
Workflow SOP Template	Document inputs, AI step, review, output, and retention.	Ready
Reusable AI Working Brief	Make one prompt reusable by the full team.	Ready
Review Checkpoint Worksheet	Name reviewer, criteria, and escalation path.	Ready
Time-Saved Tracking Sheet	Track baseline, draft time, correction rate, and defects.	Ready
Handoff Readiness Card	Check whether the workflow can survive a colleague handoff.	Draft

30-day operations path

1. Week 1: Select one recurring internal task and map current state.
2. Week 2: Draft the workflow SOP and reviewer checkpoint.
3. Week 3: Test on real work with permitted data and track results.
4. Week 4: Hand the SOP to a colleague and fix every unclear step.

SOURCE BASIS

Built from the AiBI readiness assessment, NIST AI Risk Management Framework, AIEOG AI Lexicon concepts for human-in-the-loop review, and practical workflow control expectations from model risk and third-party risk governance. Adapt before adoption.
