

The Banker Builder Brief Kit

In 45 minutes, turn one workflow problem into a one-page Builder Brief, safe build path, test plan, and launch checklist.

What this is

A banker-friendly way to decide what should be built before the idea becomes a rogue spreadsheet, prompt, automation, or app.

What this is not

Not a software bootcamp, not permission to build production systems without review, and not an app-first framework. Most first builds should be prompts, checklists, trackers, forms, or simple workflows.

Six-step builder path

Step	Question	Output
1. Score	Is this idea worth building?	Build / no-build verdict
2. Brief	What exactly are we trying to solve?	One-page Builder Brief
3. Path	Prompt, checklist, spreadsheet, form, app, or vendor feature?	Recommended build path
4. Risk	What can this safely touch?	Green / Yellow / Red classification
5. Test	How do we prove it before launch?	Three-user prototype test
6. Handoff	Who owns it after launch?	Owner, evidence, review date, kill switch

Build smaller than the complaint

Start with the smallest controlled artifact that proves value. A prompt, checklist, tracker, or intake form is usually safer than an app. A production integration, customer-impacting workflow, or regulated decision path belongs in formal IT, InfoSec, Risk, Compliance, or Legal review.

The red line

Tier	Definition	Handling
Green	Internal or public data only; no customer impact; no production write; human review available.	Prototype with standard controls.
Yellow	Internal workflow; possible confidential data; retained business record; mandatory reviewer.	Needs owner, reviewer, evidence, and approval before reuse.
Red	Customer NPI, credit, BSA/AML, fraud, authentication, complaints, security controls, legal/compliance determinations, production write access.	Not a side build. Escalate before prototyping.

Move downstream into the SOP

If the prototype is approved for reuse, document the workflow in the AI Workflow SOP Builder: tool, allowed inputs, output, reviewer, approval checkpoint, escalation path, and retention rule.
