

Safe First Builds Menu

Start with low-risk artifacts that improve bank work without touching customer decisions, credentials, production systems, or regulated records.

Safe first build	What it does	Why it is a good starter
Procedure-to-Job-Aid Builder	Turns approved procedure text into a frontline checklist with escalation triggers.	Internal, reviewable, useful immediately.
Handoff Summary Generator	Turns internal status notes into clean shift, branch, lending, or operations handoffs.	Reduces tribal knowledge.
Review Checklist Builder	Turns a process into a repeatable QA, compliance, or manager review checklist.	Creates consistency without automation risk.
Evidence Packet Assembler	Creates an index of source documents, reviewer notes, approvals, final output, and retention location.	Aligns with governance and exam readiness.
Training Scenario Generator	Creates fictional role-play cases for branch, operations, lending, BSA/AML, or call center training.	No customer data needed.
Vendor Question Builder	Creates due-diligence questions from a vendor description or AI feature.	Useful to business and risk teams.
Dashboard Narrative Draft	Turns approved metrics into a draft management update with assumptions and open questions.	Internal, measurable, human-owned.
Exception / Issue Tracker	Tracks recurring errors, reviewer corrections, bottlenecks, incidents, and next actions.	Improves operations without touching decisions.

Stop and escalate if the build needs customer NPI, account data, credit or BSA/AML decisions, fraud or authentication controls, complaint handling, legal/compliance determinations, API keys, credentials, or production write access.
